Selected Research Projects

|--------------|--|---------------------------------------|
| 2010-Present | Large-Scale Multi-Task Learning | <i>Machine Learning Methodologies</i> |
| | Many real world machine learning problems involve the learning of related tasks, which commonly share certain knowledge. The multi-task learning (MTL) aims at simultaneously learn the related tasks and improve the generalization performance by leveraging the shared knowledge. In this project, my goal is to design novel MTL formulations and develop efficient optimization algorithms for large scale learning problems. Besides, I have developed an open source machine learning package called Multi-tAsk Learning via StructurAl Regularization (MALSAR), which is the largest MTL software and widely used in the community. The package is available at www.MALSAR.org . | |
| 2010-2013 | Modeling Disease Progression | <i>Machine Learning Applications</i> |
| | The development of many progressive diseases such as Alzheimer’s involves complex pathological manifestations. Longitudinal studies on such diseases have provided important information about the progression of the disease and also many | |

candidate biomarkers from medical images to plasma panels. In this project I have develop novel machine learning models to build effective predictive models for such diseases, leveraging the temporal information in the longitudinal data. The models are also capable of identifying important biomarkers that signal the progression and their temporal dynamics.
